

Sprint 1 Overview

Sprint 1 was focused on data collection and feedback for the company's app, and the data team was responsible for gathering information for other teams and helping with the data collection process. However, the team faced a communication issue as different members had different ideas about what they were doing. This issue was quickly resolved after incorporating daily stand-ups towards the end of day two. With this, the team was able to work effectively and efficiently towards achieving their goals.

To collect data from the app, the team had to develop a system that would allow them to track user activity and behavior. I was assigned to work on the feedback system which allowed users to provide comments and suggestions about the app. I also worked on analyzing the collected data and presenting it to other teams in a format that was easy to understand.

The deliverables of this sprint included a data collection system, a feedback system, and data analysis and visualization. The early stages of the sprint work included the planning and analyzing of the data collection and feedback systems. The final product was a comprehensive data report that was presented to our teachers, highlighting user behavior, feedback, and suggestions for improvements. Overall, the data team was able to successfully complete their sprint objectives and contribute to the company's ongoing development efforts.

Sprint 1 Deliverable

Based on my user story, I was able to create a review section within our app to enable festival-goer users to give their feedback and thoughts. This user story provided a clear objective for our sprint, and our team was able to turn it into a tangible deliverable. We successfully incorporated this new feature into our app, and we have included relevant screenshots, user flows, and other visuals that demonstrate how the review section functions within the app in our sprint deliverables. Additionally, we conducted extensive background research during the sprint, which may not be immediately visible in the final deliverable, but it is a crucial component of our development process.

In our sprint deliverables, we have provided a brief summary of the research conducted, highlighting any key insights or findings that influenced our decision-making. We believe that this will give stakeholders a more complete understanding of the work that was done during the sprint and the value it provides to the app and its users. Overall, our sprint deliverables showcase both the tangible output of our team's efforts (i.e. the review section within the app), as well as the process and research that went into creating it. We are confident that this approach will help our stakeholders appreciate the value of our work and the impact it will have on the user experience.

This link leads to the concept, and fully coded version of my task, the review aspect to our app.
